## 16 - Shruti Gauchandra

## Assignment - 2

- 1. You are given a large log file containing various system events. Each line in the log file follows this format: [YYYY-MM-DD HH:MM:SS] [LOG\_LEVEL] [MODULE] Message where: YYYY-MM-DD HH:MM:SS is a timestamp. LOG\_LEVEL can be INFO, WARN, ERROR, or DEBUG. MODULE represents the system module name (alphanumeric, can contain underscores). Message is the actual log message (it may contain any characters). Your Task Write a function extract\_critical\_errors(log\_data: str) -> list[tuple] that takes a multiline string log\_data (containing log entries) and returns a list of tuples containing:
- 2. The timestamp
- 3. The module name
- 4. The error message BUT only if: The LOG\_LEVEL is ERROR. The message contains at least one IP address in IPv4 format (xxx.xxx.xxx, where xxx is in the range 0-255). The message contains a hexadecimal error code, formatted as 0x followed by exactly 8 hexadecimal digits (0-9, A-F).
